```
The present sequence encodes a human regulator of intracellular phosphorylation (HRIP). HRIP is useful for screening agonists and antagonists of HRIP pollypeptide. HRIP and its agonist or antagonist and cancer as the set of the sequence of the sequence of the sequence of the decreased with decreased or increased expression of functional HRIP. Diseases treated cor diagnosed include neurological disorders such as stroke, parkinson's disease, demyelinating diseases, bacterial and viral meningitis and other developmental disorders, myasthenia gravis, cell proliferative disorders such as actinic keratosis, arteriosolerosis, atherosolerosis and cancer including leukaemia, melanoma, myeloma and cancer of the adrenal gland, bladder, bone, bone marrow, liver, lung, muscle, ovary, autolmunoc/ infinammatory disorder such as Addison's disease, acquired inmunodeficiency diseases, allargies, bronchitis, diabetes mellitus, or rheumatold arthritis, microbial infection and trauma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches 1573; Conserv

                                                                                                                                cc of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end cc sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CC cDNAs easily without any specialised methods. AAH33166 to AAH33628 and CC AAB5383 represent human canid sequences; and AAH33629 to AAH33632 represent numan amino acid sequences; and AAH3629 to AAH33632 represent oligonucleotides, all of which are used in the exemplification

γQ В 8 밁 Ş В δÃ 밁 Ş рь á g 20 В

cc full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligo-dto comprises complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a polynucleotide which comprises a 3'-end sequence, where the coligonucleotide which comprises a 3'-end sequence, where the coligonucleotide comprises a 3'-end sequence, where the coligonucleotide comprises as 1 nucleotides and the combination of the 5'-end sequence'3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, complementary to a particularly full-length cDNAs. The primers are useful for synthesising polynucleotides, continuated the specification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs are useful for synthesis of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs are primers allow obtaining

                                                                                                                                                                                      The present sequence is human sphingosine kinase type 1 (hsk1) cDNA. The hsk1 gene is located on chromosome 17q25.2. The sk1 converts the substrate sphingosine to sphingosine-1-phosphate (S1P). The sk1 gene and encoded polypeptide are applicable in screening drug candidates particularly inhibitors for preventing or treating disorders such as haemostasis, thrombosis, allergic reactions, proliferative diseases including cancer, haematopoietic disorders such as leukaemia, cardiovascular diseases such as stroke, atherosclerosis and coronary artery disease, dyslipidaemia, diabetes including type I and type II diabetes, autoimmune and inflammatory diseases such as multiple sclerosis, T helper-1 related diseases, chronic obstructive pulmonary disease, asthma, myocardial infarction, neurodegenerative disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  atherosclerosis; coronary artery disease; dyslipidaemia; diabet autoimmune disease; inflammatory disease; multiple sclerosis; Thelper-1 related disease; chronic obstructive pulmonary diseasthma; myocardial infarction; neurodegenerative disorder; wound healing; embryogenesis; anticoagulant; cerebroprotective;

SphK is useful for treating a SphK-associated disorder especially cancers such as leukaemia, lymphoma, ovarian, breast, lung, colon, testicular, stomach and skin, atherosclerosis, restenosis or ischaemia and cell proliferative disease or disorder associated with vascular diseases. SphK gene is used in gene therapy and antisense-therapy. Sphingolipids serving as signalling molecules, have recently emerged as regulators of cell growth, differentiation, diverse cell phenotypes and cell death. Activation of sphK by tumour necrosis factor (TNF) alpha inhibits apoptosis in human endothelial cells. The present sequence is human sphingosine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

CC encoding human secreted proteins (AAW88453) to AAW88756). The secreted concoding human secreted proteins (AAW88754) to AAW88756). The secreted concoding human sequences are deposited with the ATCC under deposit numbers can gene sequences are deposited with the ATCC under deposit numbers concoding the nucleic acid sequences are sequences are deposited with the ATCC under deposit numbers colored to the comprising recombinant vectors containing the nucleic acid sequences are used for the recombinant production of the secreted consequences are useful for preventing treating or ameliorating medical conditions e.g. to proteins. The polynucleotide and amino acid sequences are useful for are combinant vectors containing the nucleic acid sequences are useful for for preventing treating or ameliorating medical conditions e.g. to protein or gene therapy. Pathological conditions can be also comprised by determining the amount of the new polynucleotides. It is a sample compared to the production of the polynucleotides are described for each of the polynucleotides are developing conditions in the new polynucleotides. Specific uses are described for each of the polynucleotides are also conditions for the diagnosis or treatment of cancer, neurodegenerative condisorders, tumours, leukemias, diseases of the immune system, autoimmune conditions to the present separatic and renal diseases. Jumphomas, inflammation, allergies, ischemic shock, Alzheimer's and cognitive disorders, schloophrenia, created sexually prostate diseases, obesity, disorders, diseases of testes.

CC unds or thymus, disestive/endocrine disorders, diseases of testes.

CC unds or thymus, disease, obesity, disorders involving osteoclasts conditions are also useful for identifying their binding partners.

CC the present sequence represents a gene encoding a human secreted protein conditions and clone identification).

ABB50301 to ABB51287 and ABA83194 to ABA83441 represent human secrete proteins (I) and polynucleotide (II) sequences. (I) and (II) have variactivities based on the tissues and cells the genes are expressed in. Example of these activities include: immunomodulatory; antisclerotic; dermatological; immunosuppressive; antiinflammatory; immunostimulant; anti-HIV, cytostatic; cardiant; anti-anglogenic; ophthalmological; neuroprotective; nootropic; anticonvulsant; antialzheimers; vascular;

(I) and (II) can be used in gene therapy and vaccine production. (I) and (II) can be used in the prevention, diagnosis and treatment of immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immunodeficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases (e.g. Scimitar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabettle retinopathy), neurological disorders (e.g. Huntington's chorea, Alzhelmer's disease and parkinson's disease), infectious diseases and/or for promotting wound healing, regeneration and/or chemotaxis. ABA83185 to hab83193 and ABB50300 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1533 BP; 272 A; 454 C; 495 G; 302 T; 10 other;

                                                                                                                                                                                                                                      1275
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  19-MAY-2000;

                                                                                                                                                                                                                                                                           The present sequence is that of an isolated polynucleotide encoding CC human sphingosine kinase A (SKA, see AAY96057), an enzyme that CC phosphorylates sphingosine to form sphingosine 1 phosphate. The phosphate.

CC The polynucleotide was isolated from an HeLa cDNA library by CP CR amplification. The invention provices polynucleotides (see AAA96057-59) for the human cC sphingosine kinase (SK) bomologues SKA, SKB and SKC. The cC polynucleotides may be used as hybridization probes, in the CC primers for chromosome and gene mapping, in the CC construction of PCR primers for chromosome and gene mapping, in CC the recombinant production of SKA, SKB and SKC, and in the CC enstruction of antisense DNA or RNA. They can be used to detect inflammation or disease associated with abnormal levels of SK contains and carrier or affected individuals. Host cells expressing CC inflammation or affected individuals. Host cells expressing CC inflores, ligands or their analogues can be used as bioactive agents to treat inflammation or disease including viral, bacterial CC associated with trauma, hereditary disease, mechanical injury can other conditions with activate the genes of kidney, lung, heart, lymphoid or tissues of the nervous system.

    The invention relates to human nucleic acids (AAI57799-AAI61369) the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are in gene therapy. A composition containing a polypeptide or polynof the invention may be used to treat diseases of the peripheral
                                                                                                                                      Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             26-DEC-2000;

The human SK protein, encoding nucleic acids and modulators are useful for modulating expression, functional activity or cellular functional activity of sphingosine kinase in a subject and also for treating a mammal by modulating the activity of SK. Diseases treated by regulating SK cellular activity include rheumatoid arthritis, astima, atheroscierosis, inflammation, meningitis, multiple scierosis and septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel sphingosine kinase protein and nucleic acid molecules for diagnosis, prophylaxis and treatment of rheumatoid arthritis, asthma, atherosclerosis, inflammation, meningitis, multiple sclerosis and septic shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1205 BP; 196 A; 357 C; 400 G; 252 T; 0 other; .

Also described is an array of nucleic acid polymers immobilised on a solld support, comprising a solid support, at least two different nucleic acid polymers which are each specific for a different 'gene associated with lipid metabolism, synthesis or action, where each nucleic acid polymer is located at a predetermined position on the solid support, and the array comprises nucleic acid polymers which are specific for less than 100 genes other than the selected genes. The method is useful for determining tumour characteristics in a tissue sample taken from a patient. The present sequence represents a human lipid-associated gene related cDNA sequence, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1173

The polynucleotides are useful in gene therapy A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathles and central nervous system disease, such as Alzhelmer's, Parkinson's disease, Huntington's disease, amportophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activiny chamotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukagmias and c. N.S disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1200 BP; 218 A; 353 C; 375 G; 254 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    specification.

second messenger, and confers serum-independent growth; increases proliferation, and suppresses serum-deprivation or ceramide-induced apoptosis. The sphingosine kinase nucleic acid is used: (a) to increase sphingosine kinase content of cells, specifically for reducing cell death and/or increasing cell proliferation; and (b) to produce transfected cells that are used to screen for agents that inhibit or promote sphingosine kinase activity. Agents that reduce sphingosine kinase activity. Agents that reduce sphingosine kinase activity or expression are used: (i) to reduce cell proliferation, specifically for treating cancer, and (ii) to treat diseases associated with abnormal cell migration or motility, particularly cancer, restenosis or diabetic neuropathy (but also atherosclerosis, stroke and Alzheimer's disease), whereas agents that stimulate sphingosine kinase can be used to treat conditions associated with reduced cell proliferation, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence tag database) using amino acid sequence results from sequenced tryptic digests of the rat sphingosine kinase. Expression of sphingosine tryptic digests of the rat sphingosine kinase. Expression of sphingosine tryptic digests of the rat sphingosine of sphingosine-1-phosphate, a known kinase in cells results in formation of sphingosine-1-phosphate, a known
developmental
retardation.

SphK is useful for treating a SphK-associated disorder especially cancers such as leukaemia, lymphoma, ovarian, breast, lung, colon, testicular, stomach and skin, atheroscierosis, restenosis or ischaemia and cell proliferative disease or disorder associated with vascular diseases. SphK gene is used in gene therapy and antisense-therapy. Sphingollpids serving as signalling molecules, have recently emerged as regulators of cell growth, diverse cell phenotypes and cell growth, diverse cell phenotypes and cell death. Activation of SphK by tumour necrosis factor (TNF)-alpha inhibits apoptosis in human endothelial cells. The present sequence is consensus mouse sphingosine tinace (Schk) (TNR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1759 BP; 357 A; 495 C; 523 G; 384 T; 0 other;
